COMP90043: Cryptography and security Week 6: Workshop Questions

Preparation:

(1) Try at home before coming to workshop] Perform encryption and decryption using the RSA algorithm, as in Figure 9.5 (of teh textbook), for the following:

(a)
$$p = 3$$
; $q = 11$, $e = 7$; $M = 5$
 $n = 33$; $\phi(n) = 20$; $d = 3$
 $C = 5^7 \mod 33 = 14$
 $M = 14^3 \mod 33 = 5$

(b)
$$p = 5$$
; $q = 11$, $e = 3$; $M = 9$
 $n = 55$; $\phi(n) = 40$; $d = 27$
 $C = 9^3 \mod 55 = 14$
 $M = 14^{27} \mod 55 = 9$

(c) p = 7; q = 11, e = 17; M = 8

$$n = 77; \phi(n) = 60; d = 53$$

 $C = 8^{17} \mod 77 = 57$
 $M = 57^{53} \mod 77 = 8$

(d) p = 11; q = 13, e = 11; M = 7

$$n = 143; \phi(n) = 120; d = 11$$

 $C = 7^{11} \mod 143 = 106$
 $M = 106^{11} \mod 143 = 7$

(e)
$$p = 17$$
; $q = 31$, $e = 7$; $M = 2$
 $n = 527$; $\phi(n) = 480$; $d = 343$
 $C = 2^7 \mod 527 = 128$
 $M = 128^{343} \mod 527 = 2$

Questions: Part A

(1) State Fermat's and Euler's theorems. Using these two theorems simplify the following equations.

Fermat's: if p is prime, then for any integer a,

$$a^p = a \pmod{p}$$

Euler's: if a and n are coprime, then

$$a^{\phi(n)} = 1 \pmod{n}$$

(a)
$$4^{12} \pmod{21} = 1 \pmod{21}$$

(b)
$$2^{22} \pmod{23} = 1 \pmod{23}$$

(c)
$$3^{17} \pmod{17} = 3 \pmod{17}$$

(d)
$$5^{35} \pmod{17} = 5^3 \pmod{17}$$

- (e) $73^{10001} \pmod{101} = 73 \pmod{101}$
- (2) CRT Question. Solve for x satisfying the following simultaneous congruences:

$$x \equiv 7 \pmod{11},$$
$$x \equiv 9 \pmod{13}.$$

7 mod 11 is congruent to 18, 29, 40, 51, 62, 73, 84, 95, 106, 117, 128, 139. 9 mod 13 is congruent to 22, 35, 48, 61, 74, 87, 100, 113, 126, 139. Hence, x = 139.

Let $a_1 = 7$ and $a_2 = 9$; $n_1 = 11$ and $n_2 = 13$. There exists m_1 and m_2 such that $m_1n_1 + m_2n_2 = 1$. Using Extended Euclidean algorithm, we find $m_1 = 6$ and $m_2 = -5$. Finally, $x = a_1m_2n_2 + a_2m_1n_1 = 7 \times -5 \times 13 + 9 \times 6 \times 11 = 139$.

(3) CRT Question. Solve for x satisfying the following simultaneous congruences:

$$x \equiv 2 \pmod{3},$$

$$x \equiv 3 \pmod{5},$$

$$x \equiv 2 \pmod{7}.$$

$$x = -82 \pmod{105} = 23 \pmod{105}$$

(4) Assume that Alice chooses two primes 43 and 47 to construct her RSA key prime factors. Help her to set up public and private keys and demonstrate encryption and decryption with an example. Choose the smallest possible exponent for the public key.

$$n = 2021; \phi(n) = 1932.$$

Smallest (non-trivial) e is 5.

Therefore, $5 \times d = 1 \mod 1932; d = 773.$

Suppose we have M = 313.

For encryption, $C = 313^5 \mod 2021 = 464$.

For decryption, $M = 464^{773} \mod 2021 = 313$.

- (5) Demonstrate CCA attack on textbook RSA with an example.
- (6) Suppose we have a set of blocks encoded with the RSA algorithm and we don't have the private key. Assume n = pq, e is the public key. Suppose also someone tells us they know one of the plaintext blocks has a common factor with n. Does this help us in any way?
- (7) Explain how you can use RSA encryption function to construct a digital signature scheme.
 - Public Key Parameters: (n, e)
 - Private Key parameter: (n, d)
 - Hash Function: (H)
 - Compute Signature $(S) = (H(M)d) \mod n$; [M, s] form message signature pair.
 - Verification Algorithm: If $H(M) == ((sd) \mod n)$ then accept the signature else declare verification failure.
- (8) With RSA, discuss how the concept of Blinding can be implemented?

RSA allows the incorporation of Blinding in two ways:

- By allowing the multiplication of the plaintext message with an arbitrary number before performing exponentiations which allows the operations to be performed not on the real input or the real output. Not all functions can use this approach. One example is when Alice wants Bob to return to her the result of a function F which only Bob has access to. But Alice doesn't want Bob to know the input M. By using blinding, Alice blinds, encrypts, and sends M to Bob. Bob then calculates and returns the value of F(M). Alice then decrypts F(M) and reverses the blinding to get F(M).
- RSA supports Blind Signatures, wherein similar to the above concept; the content of the passed message is oblivious to the person signing it. This is applicable when the authenticity of the message needs validation from an entity who did not write the message.
